Summary

Classical logics

- ▶ assume **precision** (e.g. John is a person)
- ▶ **binary** truth values: $\{0, 1\}$ (False or True)
- ▶ main types: **propositional** logic; **first-order** logic

Fuzzy logics

- ▶ arose to handle **vagueness** (e.g. John is tall)
- ▶ infinite **degrees of truth**: $\in [0, 1]$
- ▶ main types: **fuzzy propositional** logic; **fuzzy first-order** logic
- ▶ major fuzzy logic systems: Łukasiewicz, Gödel, product (Goguen)

First-Order Logic Example

A typical first-order logic axiom (formula)

$$\forall x \left(\exists y \left(R(x, y) \wedge A(y) \right) \right)$$

Components

- ▶ variables: x, y
- ▶ predicates (n -ary relations): R, A
- ▶ logical operators/connectives: $\wedge, \vee, \neg, \rightarrow, \leftrightarrow$
- ▶ quantifiers: \forall, \exists

Various fuzzy **semantics** exist for operators/quantifiers

- ▶ Łukasiewicz, Gödel, product (Goguen), others ...
- ▶ LTN API offers a **wide selection** of these semantics

But: LTN recommends a specific **subset** of semantics

- ▶ called the “stable product configuration”
- ▶ it's the **safe choice semantics** for each operator/quantifier

Why?

- ▶ alternative semantics induce **vanishing** or **exploding** or **single-passing gradients**
- ▶ source: van Krieken et al. (2020). “Analyzing Differentiable Fuzzy Logic Operators”. *arXiv:2002.06100*

Real Logic “stable product configuration”

Stable Logical Operator Semantics

| Operator | Semantics * | Fuzzy Logic Source System |
|-----------------------------|--|---------------------------|
| And (\wedge) | $u \wedge v = uv$ | product |
| Or (\vee) | $u \vee v = u + v - uv$ | product |
| Not (\neg) | $\neg u = 1 - u$ | Łukasiewicz |
| Implies (\rightarrow) | $u \rightarrow v = 1 - u + uv$ | Reichenbach ** |
| Equiv (\leftrightarrow) | $u \leftrightarrow v = (u \rightarrow v) \wedge (v \rightarrow u)$ | (mixed) |

* u and v represent degrees of truth $\in [0,1]$

** $u \rightarrow v \equiv (\neg u) \vee v = (1-u) \vee v = (1-u) + v - (1-u)v = 1 - u + uv$

Real Logic “stable product configuration”

Existential quantifier \exists - ‘there exists’ (at least one)

Stable Semantics

The “generalised mean” (p -mean), here denoted pM :

$$pM(u_1, \dots, u_n) = \left(\frac{1}{n} \sum_{i=1}^n u_i^p \right)^{\frac{1}{p}} \quad p \geq 1$$

Summary

Real Logic “stable product configuration”

Existential quantifier \exists - ‘there exists’ (at least one)

Stable Semantics

The “generalised mean” (p -mean), here denoted pM :

$$pM(u_1, \dots, u_n) = \left(\frac{1}{n} \sum_{i=1}^n u_i^p \right)^{\frac{1}{p}} \quad p \geq 1$$

where:

- ▶ $u_i \in [0, 1] \quad i = 1 \dots n$ (degrees of truth)
- ▶ $0 \leq pM \leq 1$
- ▶ if $p = 1$, $pM = \text{arithmetic mean}$
- ▶ as $p \rightarrow \infty$, $pM \rightarrow \max(u_1, \dots, u_n)$

So, as $p \rightarrow \infty$, pM **approximates** a **maximum** function

Real Logic “stable product configuration”

Universal quantifier \forall - ‘for all’

Stable Semantics

The “generalised mean of deviations from the truth” (p -mean error), here denoted pME :

$$pME(u_1, \dots, u_n) = 1 - \left(\frac{1}{n} \sum_{i=1}^n (1 - u_i)^p \right)^{\frac{1}{p}} \quad p \geq 1$$

Summary

LTN Real Logic Axioms

What is an LTN Real Logic axiom?

- ▶ an **assertion** of **knowledge** over **data**
- ▶ a **logical constraint** to be **satisfied**
- ▶ **executable** Python **code**
- ▶ a nested function call that **returns** a **satisfaction level**
(truth degree) $\in [0, 1]$

Recall our example first-order logic axiom

$$\forall x \left(\exists y \left(R(x, y) \wedge A(y) \right) \right)$$

What is an LTN Real Logic axiom?

- ▶ an **assertion** of **knowledge** over **data**
- ▶ a **logical constraint** to be **satisfied**
- ▶ **executable** Python **code**
- ▶ a nested function call that **returns** a **satisfaction level** (truth degree) $\in [0, 1]$

Recall our example first-order logic axiom

$$\forall x \left(\exists y \left(R(x, y) \wedge A(y) \right) \right)$$

The equivalent LTN Real Logic axiom might look like

sat_level = Forall(x, Exists(y, And(Friend(x,y), Italian(y))))

LTN Real Logic Axioms

Our example axiom again

$$\forall x \left(\exists y \left(R(x, y) \wedge A(y) \right) \right)$$

\equiv

Forall(x, Exists(y, And(Friend(x,y), Italian(y))))

Summary

The (standard) LTN Loss Function

We **call** the KB and it **returns**

$$sat_level \in [0, 1]$$

The (standard) LTN **loss function** is simply

$$loss = 1 - sat_level$$

As $sat_level \rightarrow 1$, $loss \rightarrow 0$.

LTN Academic Use

Summary

A representative LTN training loop

```
...  
ds_train = # conventional training set  
...  
model = MyNeuralNetworkModelClass()  
Pred = ltn.Predicate(model) # NN (predicate) used in KB axioms  
...  
trainable_vars = Pred.trainable_variables  
optimizer = tf.keras.optimizers.Adam(learning_rate=0.001)  
  
for epoch in range(n_epochs):  
    for features, labels in ds_train:  
        with tf.GradientTape() as tape:  
            sat_level = axioms(features, labels)  
            loss = 1 - sat_level  
            grads = tape.gradient(loss, trainable_vars)  
            optimizer.apply_gradients(zip(grads, trainable_vars))  
        ...  
    ...
```

How the LTN framework trains neural networks:

- ▶ gradient descent drives **loss minimisation**
- ▶ loss minimised by **maximising KB satisfiability**
- ▶ KB satisfiability maximised by the **NN learning the function** that **best satisfies** all the **axioms**

Summary

LTN for Zero-Shot Learning with Images

Paper

- ▶ Donadello & Serafini (2019). **Compensating Supervision Incompleteness with Prior Knowledge in Semantic Image Interpretation.**

Description

- ▶ task: predict (subject,relation,object) triples (**visual relationships**) in images; e.g. (person,ride,horse)
- ▶ approach:
 - object detector detects and classifies subject/object bboxes
 - LTN-trained NNs predict the relations
- ▶ strategy: inject **relational knowledge** in the form of **negative domain and range** constraints
 - e.g. $\forall xy \text{ Ride}(x,y) \rightarrow \text{Not}(\text{Table}(x))$
 - e.g. $\forall xy \text{ Ride}(x,y) \rightarrow \text{Not}(\text{Chair}(y))$

nb: the unary predicates (e.g. $\text{Table}(x)$) for the object classes are rule-based functions returning 1 or 0;
the binary predicates (e.g. $\text{Ride}(x,y)$) for the relations are trainable NNs

LTN Academic Use

Summary

Results: NNs trained over LTN prior knowledge ...

- ▶ deliver **better** relation **predictive performance**
- ▶ including better **zero-shot** relation predictions

Issue: LTN scalability limitation

- ▶ dataset has 70 relations and 100 object classes
- ▶ ≈ 25 relations permit domain/range restrictions
 $\Rightarrow \approx 25$ **NNs** to be trained
- ▶ 100 domain + 100 range constraints ≈ 200 axioms/relation
 $\Rightarrow 25$ relations \times 200 axioms \approx **5000 axioms** in KB
- ▶ **repeated calls** to the same NNs per mini-batch
 $\Rightarrow \approx 200$ **calls** per binary predicate NN
- ▶ (nb: Donadello uses only a **“tractable sample”**)

Summary

Paper

- ▶ Badreddine & Spranger (2019). **Injecting Prior Knowledge for Transfer Learning into Reinforcement Learning Algorithms using Logic Tensor Networks.**

Discussion

- ▶ task: **grid game**; **agent** needs to learn to **collect** certain objects and **avoid** others to **maximise** cumulative **reward**
- ▶ LTN used to **preprocess** input data to **derive explicit knowledge** of which grid cells to target/avoid
- ▶ they show **agent** learns to **exploit** the **prior knowledge**
- ▶ role of LTN here is minor (incidental)

LTN with Deep Reinforcement Learning

Knowledge derivation; CNN architecture for RL system

Figure 5: Priors on the grid game

Figure 6: A Double Dueling architecture architecture with conjoint image and prior knowledge inputs.

LTN axioms for one preprocessing scenario

$$\forall x \in \mathcal{O} : \text{circle}(x) \leftrightarrow \text{goto}(x)$$

$$\forall x \in \mathcal{O} : \text{cross}(x) \leftrightarrow \text{avoid}(x)$$

LTN Reasoning Capabilities

Paper

- Bianchi & Hitzler (2019). **On the Capabilities of Logic Tensor Networks for Deductive Reasoning.**

One experiment: taxonomy reasoning

- train set: 24-class taxonomy with 23 subClassOf relations

- test set: the full transitive closure + all false relations
- objective: train NN to predict $sub(x, y)$ given arbitrary x, y

LTN Reasoning Capabilities

LTN KB axioms

- ▶ $\forall a, b, c \quad sub(a, b) \wedge sub(b, c) \rightarrow sub(a, c)$ (transitive)
- ▶ $\forall a \quad \neg sub(a, a)$ (not reflexive)
- ▶ $\forall a, b \quad sub(a, b) \rightarrow \neg sub(b, a)$ (not symmetric)

Summary

LTN Reasoning Capabilities

LTN general observations:

- ▶ higher KB **satisfiability** \Rightarrow better predictive **performance**
- ▶ more **axioms** in KB \Rightarrow better predictive **performance**

LTN weaknesses:

- ▶ **prone** to predicting **false positives**
- ▶ **struggle** with **multi-hop** inferences
 - e.g. *sub(cat, animal)* is a bridge too far
 - (i.e. training NNs to generalise remains a challenge)

LTN strength: explainability / interpretability

- ▶ LTN can provide partial explanations
- ▶ existing (or new) axiom **satisfaction levels** can be **queried** after (or during) training to provide **insight** into 1) what a model is **learning**, 2) a model's predictive **performance**
 - **query** axiom \equiv **execute** axiom

Summary

LTN for Fairness

Paper

- ▶ Wagner & Garcez (2021). **Neural-Symbolic Integration for Fairness in AI.**

One experiment: fairness in credit risk assessment

- ▶ objective: train binary classifier to avoid gender bias
 - predicate D denotes **Default** (on granted credit)
- ▶ strategy: add gender **fairness axioms** to LTN KB

| | | |
|---|--|-----------------------------|
| | $\forall x \in \mathcal{T}_D :$ | $D(x)$ |
| | $\forall x \in \mathcal{T}_N :$ | $\neg D(x)$ |
| | <hr/> | |
| | $\forall x \in \mathcal{R}_{F1}, y \in \mathcal{R}_{M1} :$ | $D(x) \leftrightarrow D(y)$ |
| people split into 5 credit quality groups | $\forall x \in \mathcal{R}_{F2}, y \in \mathcal{R}_{M2} :$ | $D(x) \leftrightarrow D(y)$ |
| | $\forall x \in \mathcal{R}_{F3}, y \in \mathcal{R}_{M3} :$ | $D(x) \leftrightarrow D(y)$ |
| | $\forall x \in \mathcal{R}_{F4}, y \in \mathcal{R}_{M4} :$ | $D(x) \leftrightarrow D(y)$ |
| | $\forall x \in \mathcal{R}_{F5}, y \in \mathcal{R}_{M5} :$ | $D(x) \leftrightarrow D(y)$ |
| | female male | |
| | fairness constraints guide the NN to not learn gender bias | |

- ▶ results: the **fairness axioms suppress** the gender bias

Summary

Uptake of LTN has been limited, so far

- ▶ 2 of the 4 papers are by students of the originators of LTN
- ▶ TensorFlow's transition from v1 to v2 likely a factor
 - TF 2 released Sept 2019
 - LTN for TF 2 not available until Jan 2021
